

# Password Visualiser

## ***What Makes a Secure Password?***

Most common security measure companies take to help their users is to provide something called a password meter which tells the user they are required to have certain requirements on your password. Most people ignore those because they are BORING!

## ***Try Password Visualiser instead.***

Visualiser below shows in greater detail how secure your password is. The brighter the color and the closer the dots are to the middle, the less secure is your password.

The dots represent hacked passwords from a public database. It shows how close they are to your own.

Less Secure  
Brighter/Closer

More Secure  
Darker/Further
